

The Sahara Forest Project (SFP) provides an integrated solution to global water, food, and energy challenges through a unique combination of proven environmental technologies, such as concentrated solar power, modern biomass production, and the *Seawater Greenhouse*. The SFP offers a vision of using these technologies on a large scale to revegetate arid areas and create freshwater, food, electricity, and bioenergy. During our topical lunch meeting, we discussed joint efforts for integrating algal bioenergy production into SFP initiatives, especially in Qatar. Plans were discussed for continued meetings and discussions later this month in Qatar and beyond.
